6. Image stored in the private registry
7. Registry role assignments
8. Cluster role assignments

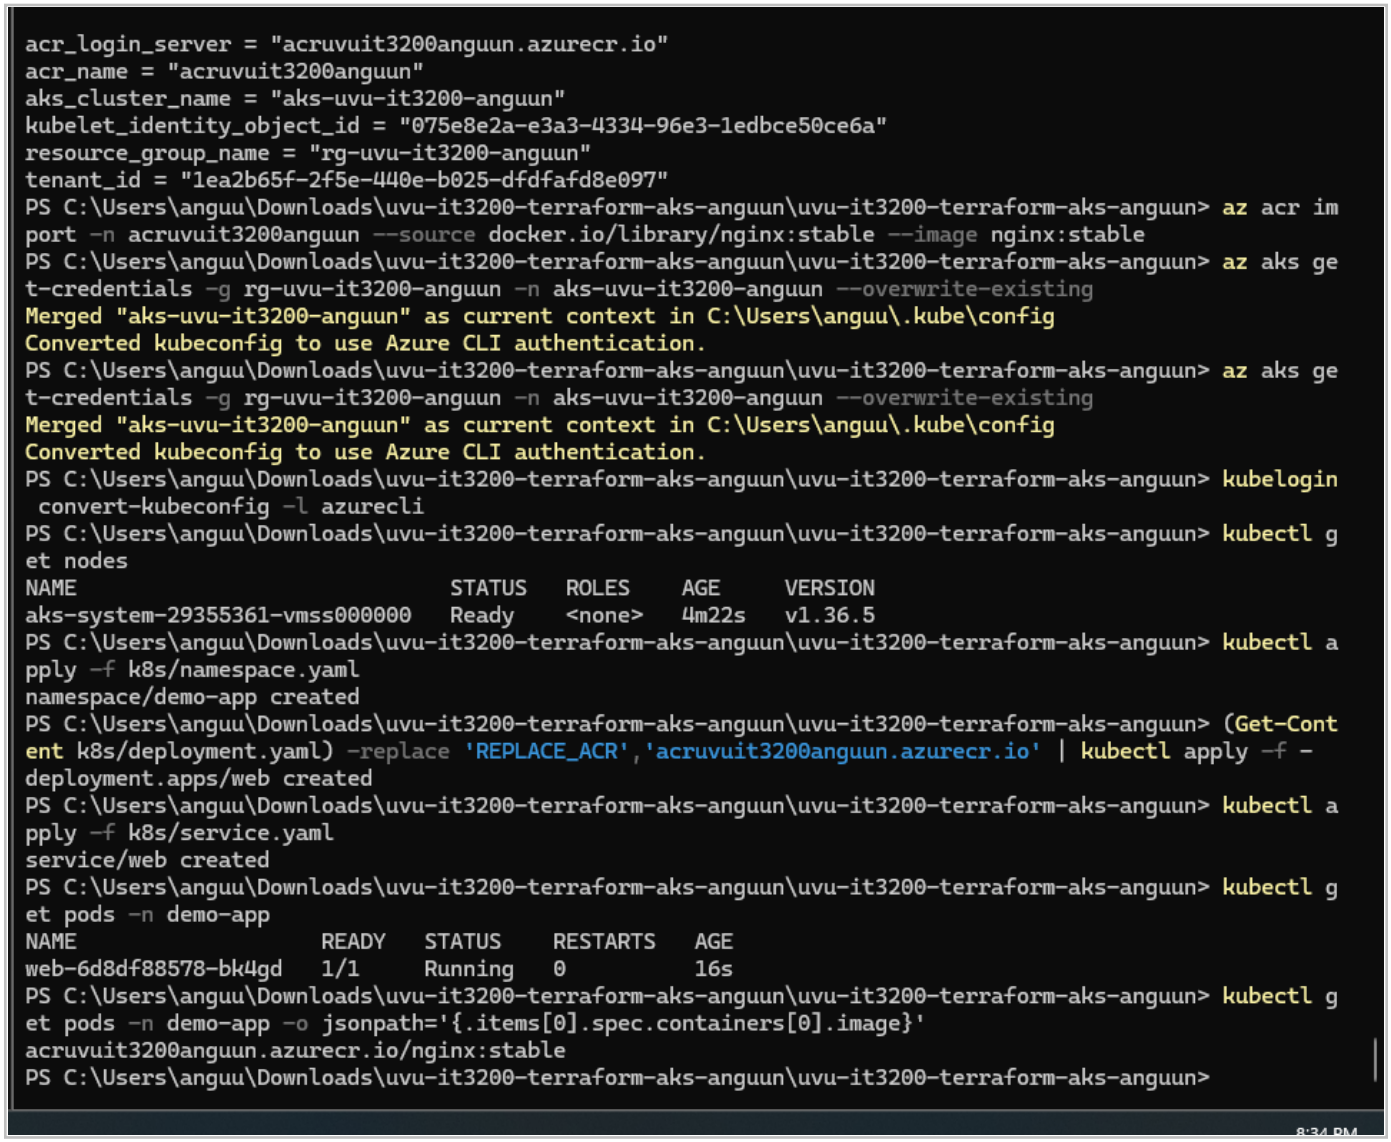

1. Terraform apply complete

Apply complete: AKS cluster and two role assignments added (resource group and registry were created first). Outputs shown.

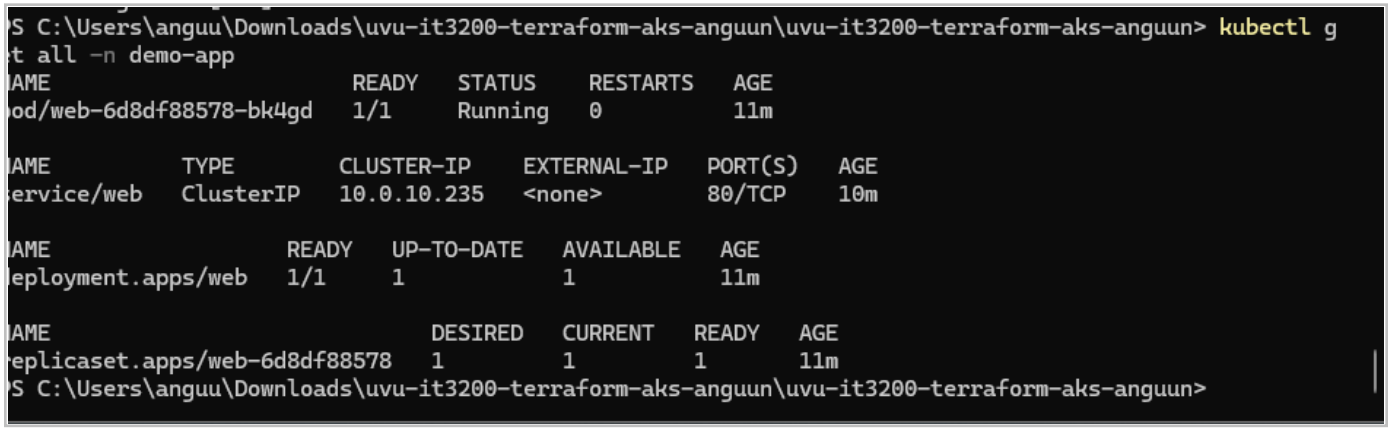

2. Cluster and app status from kubectl

Image imported into ACR, credentials fetched, node Ready, pod Running, and the pod image is acruvuit3200anguun.azurecr.io/nginx:stable (pulled from the private registry).

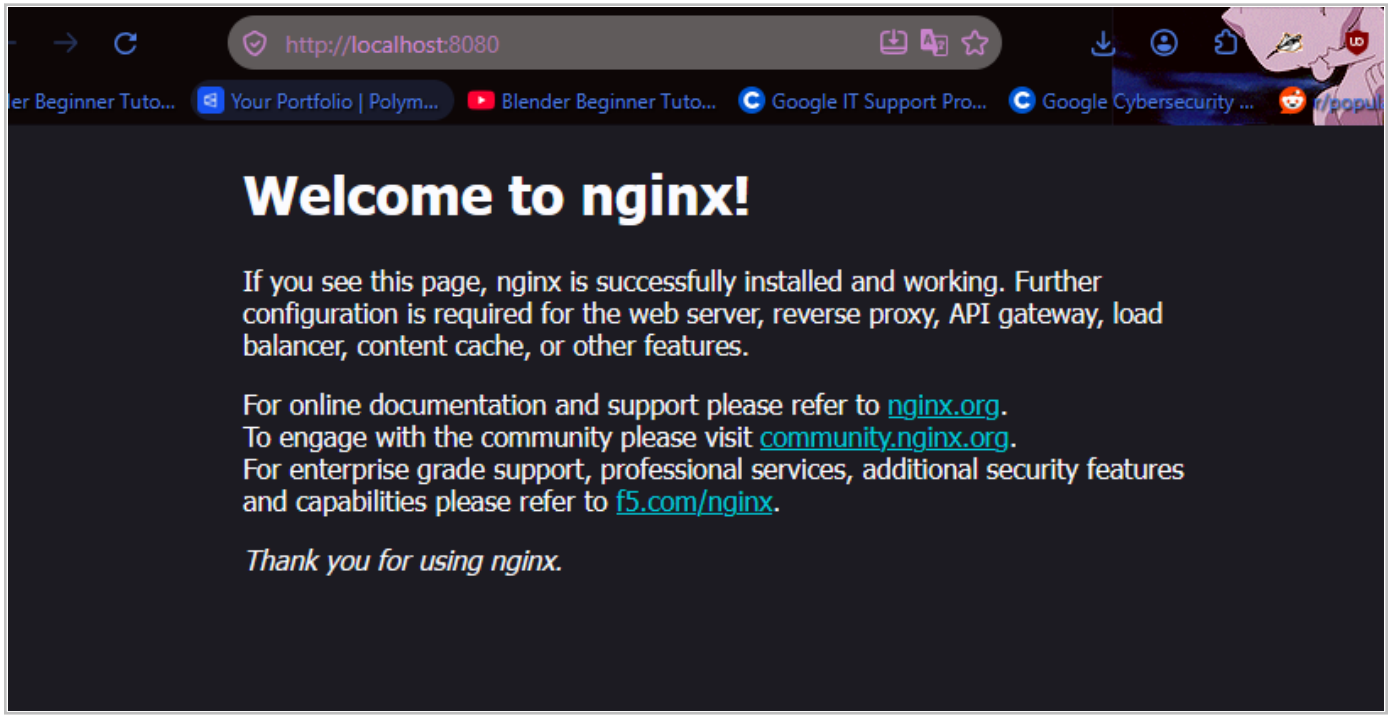

3. Everything in the demo-app namespace

Pod, service, deployment and replica set are all healthy (pod 1/1 Running).

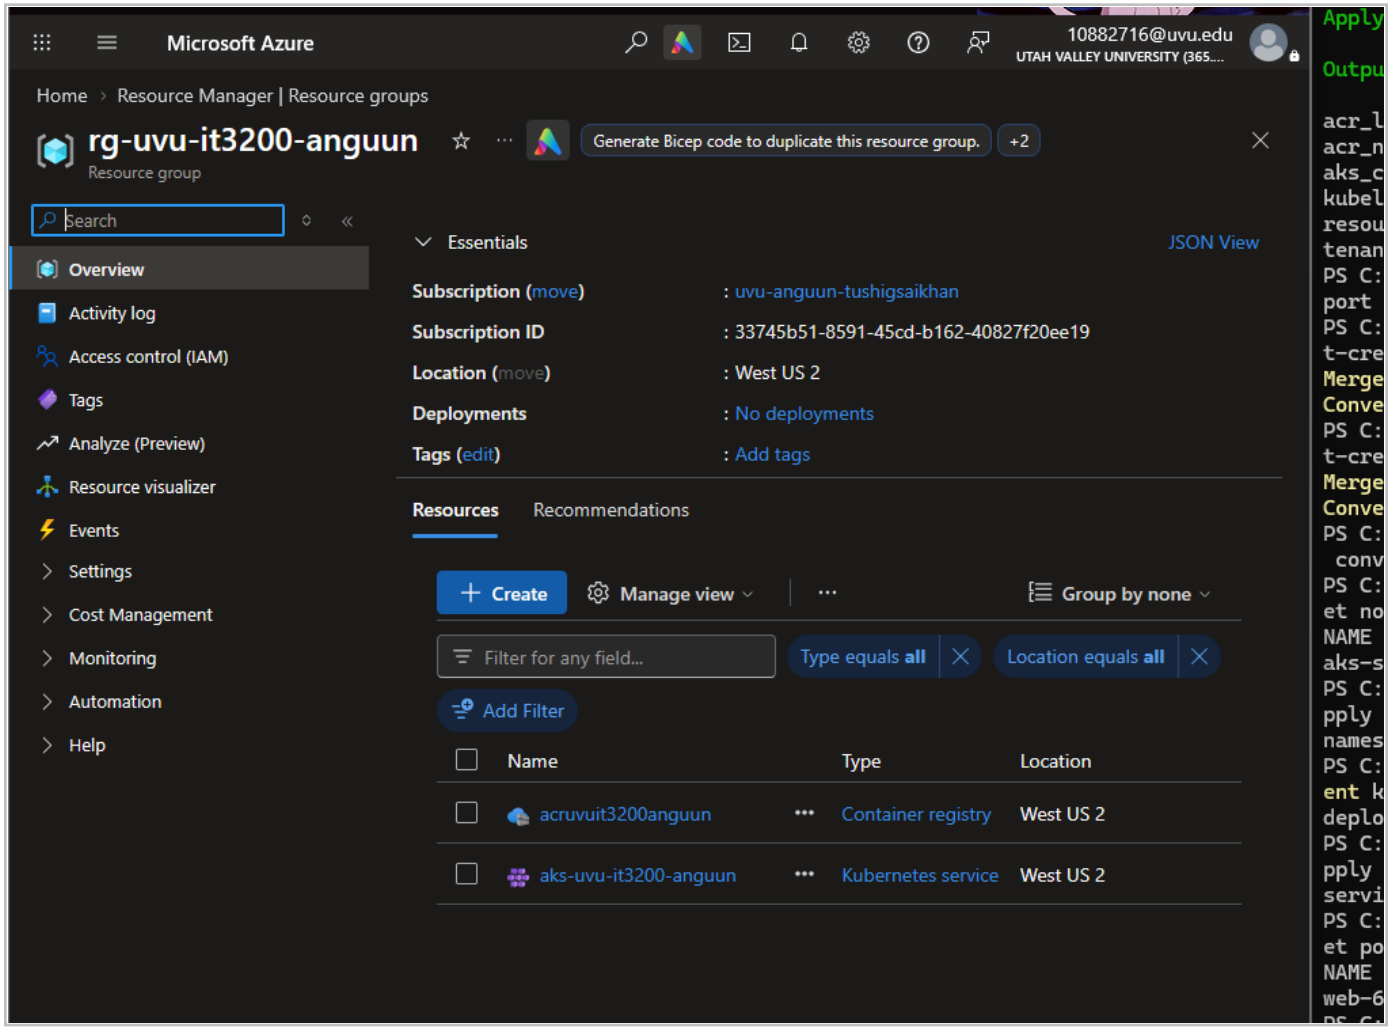

4. App running in the browser

The nginx welcome page served from the pod on AKS through kubectl port-forward at http://localhost:8080.

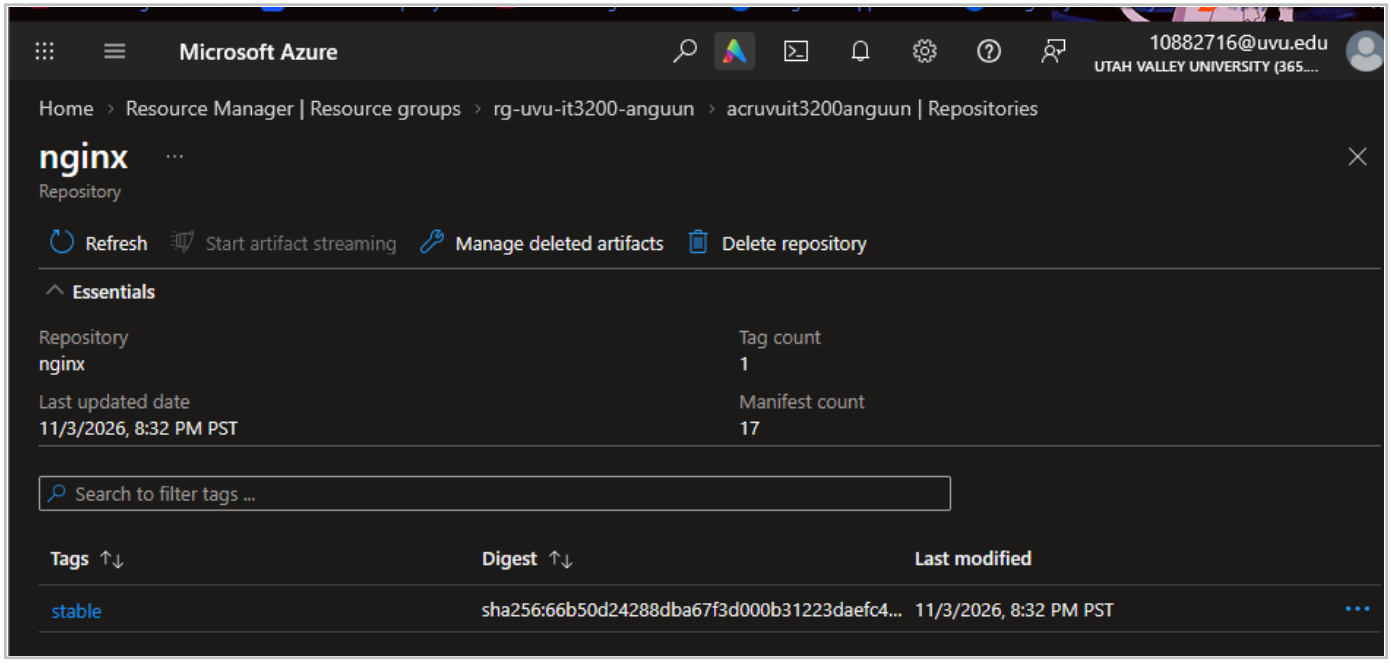

5. Resource group

rg-uvu-it3200-anguun contains the container registry and the Kubernetes service.

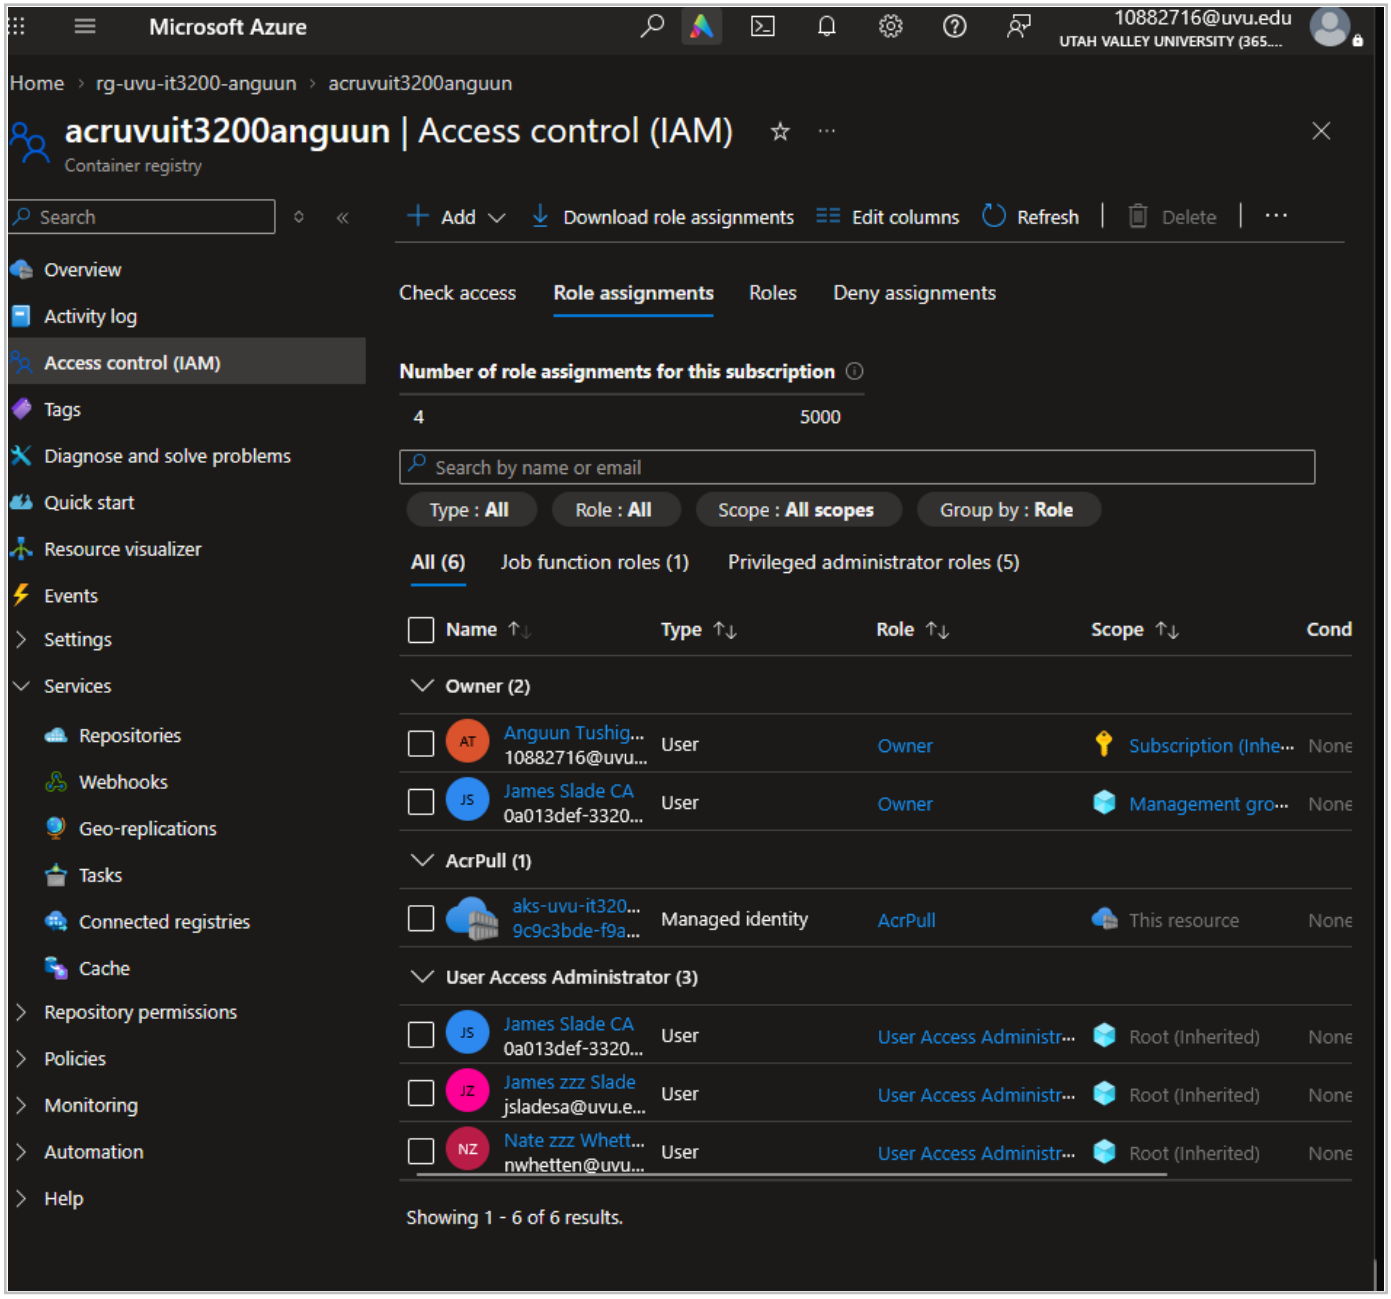

6. Image stored in the private registry

The nginx repository in acruvuit3200anguun has the stable tag.

7. Registry role assignments

AcrPull is granted to the AKS kubelet managed identity on the registry only.

8. Cluster role assignments

Azure Kubernetes Service RBAC Cluster Admin is assigned to my account on the cluster (temporary).
